

PROBLEM

We have a number of users that we need to keep track of, we also wish to keep track of the connections between users.

SOLUTION

We would like you to build a web app that allows to:

- Add a user.
- Add a connection between 2 users.
- Retrieve all the users that are directly connected with a given user.
- Show a stats report regarding the relations between the users.

RESTRICTIONS

- you must use python with any framework for the backend and react for the frontend.
- You may use database of your choice
- Consider that your solution should come with deployment instructions and tests

DELIVERY

Create a project available through a public repository (e.g. git) that we can access (we would like to be able to see how your solution progresses).
